

For Diabetic Patients

Type 1 Diabetic

With appropriate insulin administration, yields euglycemia.

1st Bottle:

Drink the night before surgery once in the fasting window

2nd Bottle:

 2 hours before surgery

Patients simply “match their short-acting insulin injections” to their blood glucose level and to the carb load that is listed on the drink label.

Type 2 Diabetic

With preservation of their oral anti-hyperglycemic agent schedule at bedtime.

1st Bottle:

Drink the night before surgery once in the fasting window

2nd Bottle:

 2 hours before surgery

Morning dose of oral agent may be held based on the actual surgical time, e.g., as when surgery is scheduled as one of the first cases of the morning.
